

Bath-Maria Still 60 Liters

Ref: ALB045

Double boiler with 2 handles
Helmet with 2 handles
Connection tube with quick unions in brass
Coil
Cooling tank

Handcrafted alembic, made of copper, soldered with pure tin, or riveted upon customer's request.
It has a double boiler, water is placed between the two boilers.

Composed of:

□1 double boiler with 2 handles □1 helmet with 2 handles □1 connection tube with quick unions in brass □1 coil and cooling tank
Alembics are a traditional piece of equipment used for distilling liquids, especially in the production of alcoholic beverages such as whiskey, vodka, rum, among others. They consist of a heated container where the liquid is placed to evaporate and then condense back into liquid vapor form. There are different types of alembics, each with its specific characteristics, but generally, they include three main parts: the heating container, the swan neck, and the condenser. The heating container, often called a boiler, is where the liquid is heated until it reaches the boiling point. The swan neck is an inclined piece that allows the vapor to be conducted out of the boiler, while the condenser cools the vapor back into liquid. Alembics are widely used in the production of craft alcoholic beverages, where they are valued for their ability to produce high-quality beverages with distinctive flavors. They are also used in industrial processes for large-scale production of distilled beverages.

Available 1 to 2 weeks after payment.
