

Electric Boiler for Melting Wax 110 liters round

Ref: CAL013

With steam generator

A wax melting boiler is equipment used in the process of melting and purifying beeswax. This boiler is specifically designed to handle solid wax, transforming it into a liquid state to facilitate its use in various applications, such as candle making, cosmetics, or polishing products.

Typically made of stainless steel or other heat-resistant material, the boiler has sufficient storage capacity to melt a specific amount of wax. It is equipped with a heating system, such as an electric resistance or a gas burner, which gradually raises the temperature until the wax is completely melted. Additionally, some boilers have additional features, such as thermostats to control the temperature accurately and safety valves to prevent overheating.

The melted wax is then poured into molds or suitable containers to solidify and be subsequently used in different production processes. These boilers are essential in beekeeping operations and in industries that use beeswax as a raw material, ensuring that the material is processed efficiently and safely. They play an important role in producing high-quality final products and maximizing the utilization of natural resources.
