

### Plastic bucket 80kg honey with lid and tap AP005

Ref: BAL005

A bucket of about 80 kg to store honey with a tap and lid is an essential equipment in the beekeeping industry.

This bucket is designed to facilitate the storage, transportation, and dispensing of honey conveniently and hygienically. Typically made of sturdy material like plastic, the bucket is capable of bearing the weight of the honey and ensuring its safety during storage. The capacity of about 80 kg makes it suitable for handling large volumes of honey produced by the beehives.

The presence of a tap at the bottom of the bucket allows the honey to be easily dispensed, without the need to repeatedly open the lid, which helps maintain the quality of the honey by avoiding excessive exposure to air and moisture. The lid is an important element to protect the honey from external contaminants such as dust, insects, and moisture, which can compromise its quality and durability. A well-fitted lid also helps preserve the flavor and properties of the honey by preventing oxidation.

In summary, the bucket of approximately 80 kg with tap and lid is a fundamental piece in the production and commercialization chain of honey, ensuring its integrity and facilitating its handling and distribution on a large scale.
